

Carbon and the Molecular Diversity of Life

70 - 95% of cell is water

the rest = carbon-based compounds

other elements = H, O, N, S and P

e.g. carbohydrates, proteins, nucleic acids,

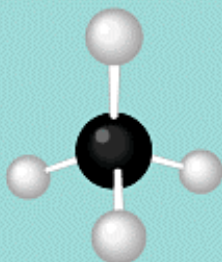

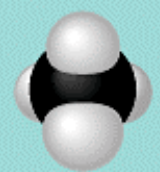

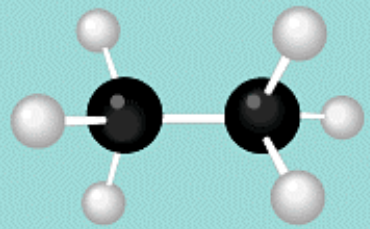

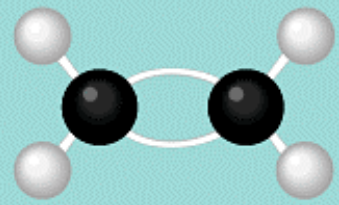

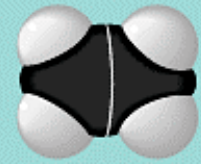

lipids

Carbon atom: the most versatile building block of molecule

- valence electron of carbon atom = 4
- can be bonded to different atom
- can be single, double or triple bonded

Shape of Simple Organic Molecules: the Hydrocarbons

Molecular Formula	Structural Formula	Ball-and-Stick Model	Space-Filling Model
CH_4	$\begin{array}{c} \text{H} \\ \\ \text{H}-\text{C}-\text{H} \\ \\ \text{H} \end{array}$		
(a) Methane			
C_2H_6	$\begin{array}{c} \text{H} \quad \text{H} \\ \quad \\ \text{H}-\text{C}-\text{C}-\text{H} \\ \quad \\ \text{H} \quad \text{H} \end{array}$		
(b) Ethane			
C_2H_4	$\begin{array}{c} \text{H} \quad \quad \text{H} \\ \diagdown \quad / \\ \text{C}=\text{C} \\ / \quad \quad \diagdown \\ \text{H} \quad \quad \text{H} \end{array}$		
(c) Ethene (ethylene)			

Variation of Carbon Skeleton:

length, branched, cyclic structure or double bonded

Ethane

Propane

Butane

Isobutane

(a) Length

(b) Branching

1-Butene

2-Butene

(c) Double bonds

Cyclohexane

Benzene

(d) Rings

Fats: the long chain hydrocarbon compounds

Isomers

= variation in architecture of organic molecules

-the same molecular formula but different structures, thus different properties

- structural isomers

- geometric isomers

- enantiomers

Structural isomers

- differ in covalent arrangement of their atoms
 - may also differ in the location of the double bonds
- bonds

(a) Structural isomers

Geometric isomers

- the same covalent partnerships
- different in the spatial arrangement of double bond
- e.g. light-induced change of rhodopsin between 2 geometric isomers

(b) Geometric isomers

Enantiomers

-differ in spatial arrangement around an asymmetric carbon

-asymmetric carbon = carbon which is attached to 4 different atoms or groups of atoms

-enantiomers are mirror image molecule

-enantiomers have different chemical properties

-L-Dopa, is effective against Parkinson's disease.

D-Dopa is biologically inactive

-thalidomide was a mixture of 2 enantiomers. One reduced morning sickness while the other caused severe birth defect

Functional Groups

= the component of organic molecules that are most commonly involved in chemical reactions.

-molecule with different functional groups have different properties e.g. sex hormone

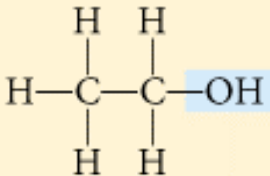

Table 4.1 Functional Groups of Organic Compounds

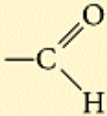

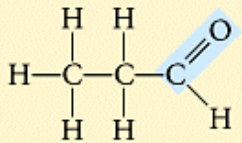

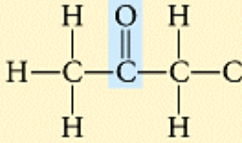

Functional Group	Formula	Name of Compounds	Example
Hydroxyl	—OH	Alcohols	 <p>Ethanol (the drug of alcoholic beverages)</p>

-the hydroxyl group is polar due to the high electronegativity of oxygen atom

-water solubility

-biomolecule containing hydroxyl group = sugar

Table 4.1 Functional Groups of Organic Compounds

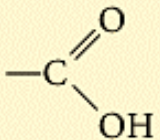

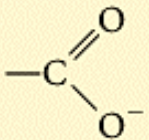

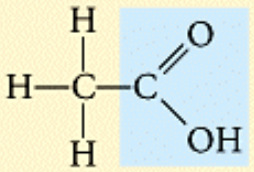

Functional Group	Formula	Name of Compounds	Example
Carbonyl		Aldehydes	 Propanal
		Ketones	 Acetone

-Aldehyde = carbon compound with carbonyl group at the end of a carbon skeleton

-Ketone = carbon compound with carbonyl group at any position (except at the end) of a carbon skeleton

-isomers with aldehyde or ketone have different properties

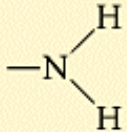

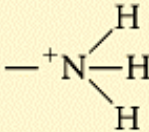

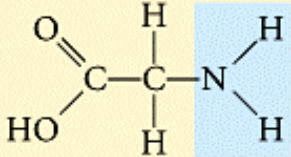

Table 4.1 Functional Groups of Organic Compounds

Functional Group	Formula	Name of Compounds	Example
Carboxyl	 (non-ionized)	 (ionized)	Carboxylic acids
			 Acetic acid* (the acid of vinegar)

*The ionized forms of the carboxyl and amino groups prevail in cells. However, acetic acid and glycine are represented here in their non-ionized forms.

- Carboxyl group is a source of hydrogen ions = acid
- dissociation of COOH to COO^-
- e.g. formic acid, acetic acid

Table 4.1 Functional Groups of Organic Compounds

Functional Group	Formula	Name of Compounds	Example
Amino	 (non-ionized)	 (ionized)	Amines
			 Glycine* (an amino acid)

*The ionized forms of the carboxyl and amino groups prevail in cells. However, acetic acid and glycine are represented here in their non-ionized forms.

- the amino group acts as base
- can pick up proton to form NH_3^+
- amino acids, the building of protein, have carboxyl and amino groups

Table 4.1 Functional Groups of Organic Compounds

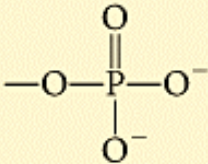

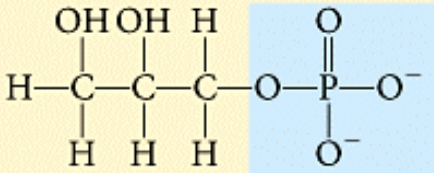

Functional Group	Formula	Name of Compounds	Example
------------------	---------	-------------------	---------

Sulfhydryl	—SH	Thiols	$\begin{array}{c} \text{H} \quad \text{H} \\ \quad \\ \text{H}-\text{C}-\text{C}-\text{SH} \\ \quad \\ \text{H} \quad \text{H} \end{array}$ Ethanethiol
------------	-----	--------	--

-sulfhydryl groups help stabilize the structure of proteins

Table 4.1 Functional Groups of Organic Compounds

Functional Group	Formula	Name of Compounds	Example
Phosphate		Organic phosphates	 Glycerol phosphate

- phosphate is an anion formed by dissociation of phosphoric acid (H_3PO_4)
- one function of phosphate groups is the transfer of energy between organic molecules.
